

md2pdf

Markdown to PDF with a live paginated preview.

 md2pdf.moon-jam.me — runs entirely in the browser

English | [繁體中文](#)

Why md2pdf

The key difference: preview shows real PDF pagination with actual margins, not just styled HTML. Code blocks stay intact across page boundaries. What you see is what you export.

Built on [Paged.js](#) for live preview layout, [Vivliostyle](#) for CLI PDF generation, [Prism.js](#) (Catppuccin Mocha) for syntax highlighting, and Noto fonts for Chinese typography.

Choose Your Workflow

Web editor (no install)

md2pdf.moon-jam.me — no install needed.

Pure frontend: your content stays in your browser, with no server upload.

- Live paginated preview updates as you type
- Open a local folder to resolve relative image paths without any upload
- Paste or drag images straight into the editor
- Resize images inline with `![alt](image.png){width=300}` or `{width=50% height=auto}`
- LaTeX math: inline `$E = mc^2$` and display `$$...$$` blocks (KaTeX)
- Custom CSS panel with live preview
- `←!— pagebreak →` to force page breaks
- Title field at the top sets the PDF filename
- Autosaves locally in your browser via IndexedDB

CLI (local + scripting)

For local use or scripting.

CLI output is powered by [Vivliostyle](#).

Requirements: Node.js 18+

Quick Start (CLI)

```
git clone https://github.com/moon-jam/md2pdf.git
cd md2pdf
npm install && npm link
```

```
# basic usage
md2pdf report.md

# watch mode (live preview in browser, auto-reloads on save)
md2pdf report.md --watch

# custom output path
md2pdf report.md -o ~/Documents/final.pdf

# change paper size
md2pdf report.md --size Letter

# custom stylesheet
md2pdf report.md --style my_theme.css
```

Example Output

Generated from this repository:

- [README.pdf](#) (from `md2pdf README.md -p`)
- [README.zh-TW.pdf](#) (from `md2pdf README.zh-TW.md -p`)

CLI Options

Flag	Alias	Description	Default
<code>--output</code>	<code>-o</code>	Output path	Same dir, <code>.pdf</code> extension
<code>--watch</code>	<code>-w</code>	Live preview in browser	<code>false</code>
<code>--style</code>		CSS file	Bundled <code>style.css</code>
<code>--size</code>		Paper size	<code>A4</code>
<code>--title</code>		PDF title	Filename
<code>--language</code>		Language metadata	<code>zh-TW</code>
<code>--page-numbers</code>	<code>-p</code>	Page numbers in footer	<code>false</code>

Styling

The bundled `style.css` controls everything: fonts, spacing, syntax highlight colours, page layout. Edit it directly and re-run.
